B. ABSTRACT

The subject invention is an improved coding system for users to gain entry into a structured system, vehicle, or other entry means, such as an entry system being based on a process where in the entry code is a mathematical formulation or other resultant formulation of a series of numbers or letters or other similar symbols, as opposed to just a series or plurality of numbers, with the mathematical resultant or other formulation or interaction of such numbers, letters, or symbols producing the sole and ultimate access code.
